

Sample Project Documentation

Date: 30.09.2026 **Team ID:** MKU201SpreadSheets
Project Name: Import data using Transform Maps

1. Project Overview

The project demonstrates a structured ServiceNow process for importing employee data from a spreadsheet, staging it through an Import Set, transforming the data using a Transform Map, reviewing the resulting Employee Tests records, and presenting the data through reports and an Employee Analytics Dashboard.

2. Source Data

The source spreadsheet contains the employee fields: **Employee ID, Name, Email, Department and Location**.

3. Solution Architecture

Layer	Component	Role
Source	Employee spreadsheet	Provides employee input data.
Ingestion	ServiceNow Load Data	Loads the source file.
Staging	Employee Import [u_employee_import]	Holds imported source data for transformation.
Transformation	Transform Map	Maps/transforms source data toward the target structure.
Target	Employee Tests [u_employee_test]	Provides the target employee records for validation.
Analytics	Reports + Employee Analytics Dashboard	Provides department, location and employee-list views.
Monitoring	Transform History	Provides execution statistics.

4. Functional Features Documented

Category	Features	Count
Data ingestion	Spreadsheet source, Load Data, Import Set staging	3
Transformation & target	Transform Map, target employee records, validation/filtering	3
Monitoring	Transform execution monitoring	1
Reporting & analytics	Department report, Location report, Employee List Report, Analytics Dashboard	4
Total	Documented project capabilities	11

5. Testing and Validation

Test area	Expected / validation point
Source structure	Required employee columns are available in the source spreadsheet.
Import	Load Data uses the Employee Import staging process.
Transformation	Transform Map provides the source-to-target transformation layer.
Target	Employee Tests records can be reviewed and filtered.
Execution	Transform History exposes processing statistics.
Reporting	Reports and dashboard display employee information.

6. Observed Project Results

The displayed Transform History execution shows **20 total records, 0 inserts, 0 updates, 3 ignored, 17 skipped and 0 errors**, with an observed execution time of **1 second**. Separately, the Employee Analytics Dashboard screenshot shows **48 employee records**, including ServiceNow 32 (66.67%) and Salesforce 16 (33.33%), with Hyderabad shown as the location view. These are treated as separate displayed project states/runs.

7. Project Demonstration Flow

1) Show the source spreadsheet → 2) demonstrate Load Data → 3) show Employee Import → 4) execute/review Transform Map processing → 5) validate Employee Tests → 6) review Transform History → 7) demonstrate reports → 8) demonstrate Employee

Analytics Dashboard.

8. Reusability and Maintenance

The configuration is organized around a dedicated import set, a central Transform Map, a target employee table/view, and separate reporting. Consistent source headers and clear component names support reuse for compatible employee spreadsheets. The supplied screenshots do not expose custom script code, so no unsupported code-level claims are included.

9. Limitations / Future Testing

The supplied evidence does not establish maximum import volume, long-term scalability, exact field-level Transform Map configuration, or the individual reasons for all skipped/ignored records. These should be tested separately if required by the project evaluation.

10. Conclusion

The project provides an end-to-end ServiceNow employee-data import workflow from spreadsheet source through staging and transformation to target validation and analytics. The documentation and execution evidence support demonstration of the configured import process and its observable results.
