

Project Design Phase – Performance Testing

Date: 30.09.2026 Team ID: MKU201SpreadSheets

Project Name: Import data using Transform Maps

Performance Testing Objective

Evaluate how the ServiceNow employee-data import process behaves during execution, with attention to import processing time, record counts, transformation throughput, skipped/ignored records, errors, and the ability to review the resulting data through the target table and reporting views.

Performance Test Scope

Area	Performance aspect	Measurement / evidence
Import execution	Time taken to process an import run.	Transform History execution time and total records.
Record processing	Volume of records handled by the run.	Total, inserts, updates, ignored and skipped counts.
Error handling	Whether processing produces errors.	Error count in Transform History.
Target availability	Whether resulting records can be reviewed after processing.	Employee Tests list and filtering.
Reporting	Whether imported data can be represented in reports/dashboard.	Employees by Department, Employees by Location and Employee List Report / Dashboard.
Repeatability	Whether the same import structure can be used for compatible source files.	Employee Import + Transform Map configuration.

Performance Test Cases

ID	Performance test	Input / condition	Expected result	Observed evidence / status
PT-01	Measure import execution time	Run the Employee Import process.	Execution completes within an observable processing period and provides execution statistics.	Transform History shows the displayed run completed in 1 second. Observed
PT-02	Measure records processed	Use the displayed import run.	Total processed count is available and consistent with the execution record.	20 total records shown. Observed
PT-03	Check successful inserts	Review insert count after the run.	Insert count is recorded without ambiguity.	0 inserts shown for the displayed run. Observed
PT-04	Check updates	Review update count after the run.	Update count is recorded.	0 updates shown. Observed
PT-05	Check skipped/ignored processing	Review ignored and skipped counts.	Non-processed records are measurable for follow-up.	3 ignored and 17 skipped shown. Observed
PT-06	Check processing errors	Review error count.	No unexpected processing errors should be reported for a successful run.	0 errors shown. Observed
PT-07	Verify post-import access	Open Employee Tests after processing.	Target records should remain accessible for review/filtering.	Employee Tests list is available and shows employee records. Observed
PT-08	Verify reporting performance	Open reports/dashboard using employee data.	Reports/dashboard should load the available employee information for analysis.	Reports and Employee Analytics Dashboard are shown. Observed
PT-09	Assess larger-volume behavior	Repeat with a larger compatible dataset.	Processing time and record counts should remain measurable; no unsupported claim is made about a specific maximum volume.	Not evidenced in supplied material. Planned

Observed Performance Baseline

Metric	Displayed value
Transform execution time	1 second
Total records	20
Inserts	0

Metric	Displayed value
Updates	0
Ignored	3
Skipped	17
Errors	0

Performance Interpretation

The supplied screenshots provide a baseline for one displayed Transform History run: 20 total records completed in 1 second with 0 errors. This is evidence for that specific run only; it is not sufficient to establish a maximum capacity, average processing time, scalability limit, or performance benchmark for larger datasets.

Performance Acceptance Criteria

- Import execution time is captured for each test run.
- Record totals and processing outcomes are available in Transform History.
- Unexpected errors are identified through the execution statistics.
- Target employee records remain available for validation after processing.
- Reports and dashboard views can present the resulting employee data.
- Larger-volume performance is measured separately before making scalability claims.

Test Data and Evidence Note

The project screenshots show a separate dashboard state containing 48 employee records, including ServiceNow 32 (66.67%) and Salesforce 16 (33.33%). Because this is not identified as the same execution as the 20-record Transform History run, it is not combined with the execution-time baseline.
