

Project Design Phase – Code Layout, Readability and Reusability

Date: 30.09.2026 **Team ID:** MKU201SpreadSheets
Project Name: Import data using Transform Maps

Project Design Phase

Code / Configuration Quality Objective

Keep the ServiceNow import solution organized, understandable and reusable by separating source data, staging, transformation, target records and reporting. Because the supplied implementation uses ServiceNow configuration features such as Load Data, Import Sets and Transform Maps rather than a large custom-code module, the quality assessment focuses on configuration layout, naming, mapping clarity and repeatability.

Layout and Readability

Area	Project implementation	Readability / layout practice
Source data	Spreadsheet with Employee ID, Name, Email, Department and Location.	Keep a consistent header row and stable field names.
Import layer	Employee Import [u_employee_import].	Use a clearly named import set and keep the staging layer separate from the target table.
Transformation	Transform Map between source and Employee Tests.	Keep mappings organized by source-to-target field and avoid unnecessary transformation logic.
Target	Employee Tests [u_employee_test].	Use clear field labels such as Employee ID, Employee Name, Department, Email and Location.
Reporting	Reports and Employee Analytics Dashboard.	Use descriptive report titles such as Employees by Department and Employees by Location.
Monitoring	Transform History.	Use execution results to identify ignored, skipped or error records.

Reusability Practices

- Reuse the same import structure for future employee spreadsheet uploads when the source columns remain compatible.
- Keep the Transform Map as the central source-to-target mapping layer rather than duplicating mappings in multiple places.
- Use consistent table and field naming so future team members can understand the configuration.
- Keep validation and reporting separate from the import transformation so the import logic remains focused.

Project-Specific Quality Evidence

The supplied project screens show a dedicated Employee Import staging table, Employee Tests target records, reports/dashboard views and Transform History. The displayed Transform History run shows 20 total records, 0 inserts, 0 updates, 3 ignored, 17 skipped and 0 errors. The screenshots do not expose custom script code, so no unsupported code-level claims are made.

Expected Result

A clean and understandable ServiceNow import configuration that can be maintained by the team and reused for compatible employee-data imports.
