

Project Design Phase – Coding & Solution

Date: 30.09.2026 Team ID: MKU201SpreadSheets

Project Name: Import data using Transform Maps

Coding / Configuration Approach

The solution is primarily a ServiceNow configuration-based implementation. The supplied project evidence centers on Load Data, an Import Set, a Transform Map, the Employee Tests target table, Transform History, reports and the Employee Analytics Dashboard. No custom script code is visible in the supplied screenshots.

Solution Implementation

Step	ServiceNow component	Implementation role	Result
1	Spreadsheet source	Provides employee data.	Source records available for import.
2	Load Data	Accepts the spreadsheet and starts the import process.	Data is staged in the import set.
3	Employee Import [u_employee_import]	Acts as the staging/import-set table.	Source data is available for transformation.
4	Transform Map	Applies source-to-target field mapping.	Records are prepared for the target table.
5	Employee Tests [u_employee_test]	Stores/reviews the transformed employee records.	Target data can be validated.
6	Transform History	Records execution statistics.	Run outcome can be reviewed.
7	Reports / Dashboard	Presents imported data for analysis.	Department, location and employee-list views.

Logical Coding / Configuration Pattern

Source fields → Import Set staging → Transform Map field mapping → Employee Tests target → Validation → Reports/Dashboard

Validation Approach

Validation point	What to verify
Source	Required spreadsheet headers are present and consistently named.
Import Set	The Employee Import table receives the source data.
Transform	The source fields are mapped to the intended target fields.
Target	Employee Tests contains the expected employee information.
Execution	Transform History is checked for totals, inserts, updates, ignored, skipped and errors.
Reporting	Reports and dashboard display the imported employee data correctly.

Coding Note

Because the supplied evidence does not show Script Includes, Business Rules, Client Scripts or other custom JavaScript, this solution is documented as configuration-led rather than claiming custom coding that is not evidenced.
